

BOWDEN CABLE CLAMP

The Bowden cable clamp is designed to provide a simple method of anchoring a typical wire wound control cable.

In some instances the wire wound type Bowden cable will not readily slide into the hole through the center of the clamp and some light sanding of the exterior of the cable may be needed. A coat of RED high temperature RTV or Silastic brand sealant should be applied to the cable during its final insertion into the clamp. When the clamp is in position in the desired anchor hole then tightening with a pair of wrenches is all that is required.
